

Washington, D. C.

February 12, 1945

FARM EMPLOYMENT RISES LESS THAN USUAL

Farm employment rose less than 1 percent during January and on February 1 totaled only 8,051,000 workers, 4 percent less than at this time last year and 11 percent below the February 1, 1935-39 average, the U. S. Department of Agriculture reported today. Unfavorable weather was partially responsible for the lowest February level of farm employment in more than two decades of record. During the 20-year period, 1925-44, total farm employment averaged 2 percent higher on February 1 than on January 1. What little increase there was this year was entirely due to a 60,000 advance in the number of hired workers. Farm family labor actually declined in number by 14,000 persons. The number of hired workers totaled 1,494,000 compared with 1,434,000 a month earlier and 1,681,000 on February 1 a year ago. The number of family workers (including farm operators) totaled 6,557,000 compared with 6,571,000 last month and 6,702,000 on February 1, 1944. Both classes of farm workers are at the lowest February level of record.

Farm activity, especially outside operations, was greatly retarded by cold weather, snow, and frozen ground in northern sections of the country. Cold weather and rain were restricting factors in much of the South.

Even the normal amount of activity at this season on New England and Middle Atlantic farms could not be carried on. Necessary travel from farm to market was done under difficulty as most of the roads were covered with ice, sleet, or snow. Farmers in many sections were occupied at digging out of snow drifts and keeping roads open to haul in necessary supplies and to deliver some products to market. Even wood-cutting had to be postponed in many localities. However, farmers were still doing many of the usual winter chores such as repairing machinery, butchering, and tending livestock. New England farms were employing 203,000 persons this February 1 compared with 211,000 last February, while on Middle Atlantic farms there were 486,000 persons doing some farm work compared with 512,000 a year ago.

In the North Central States, most field work was at a standstill because of the deep snow cover or, as in some West North Central States, because of rain. Shock corn remained in the field in many sections. Nebraska reported about 9 percent of its corn crop was unhusked at the end of January. Deep snow prevented many farmers from getting into the wood lots and manure was piling up in many barn yards. It now appears that many winter jobs will have to be completed in competition with spring work. Farm employment in these States totaled 2,523,000 February 1, compared with 2,569,000 a month earlier and 2,596,000 on February 1, 1944.

Total farm employment in the South Atlantic Region remained about the same as a month ago, but at 1,430,000 persons, was 10 percent below the February level last year. Except for the making and seeding of plant beds in the tobacco areas, planting early spring crops, harvesting winter vegetables and citrus fruit picking in Florida, most of the farm activity consisted of caring for livestock, cutting wood, repairing machinery, and general repair work on the farm.

Unfavorable weather conditions reached far into the South Central States and there was much less than the usual farm field work going on there around February 1. In the delta districts, some cotton was still in the fields to be picked. The preparation of land for corn planting in southern areas of Texas was retarded because of excessive rainfall. Fairly good progress was being made in planting truck crops, particularly in southern Mississippi and Louisiana. About 25 percent of the Mississippi cabbage crop had been set in the fields by February 1. There were 2,596,000 workers on South Central farms -- 86,000 more than on January 1 but 65,000 fewer than at this time last year.

The number of hired farm workers in the Mountain States dropped sharply during January, but the decline was slightly more than offset by an increase in the number of family workers. As a result, total farm employment reached 347,000, or 2,000 more than at the first of the year, but 12,000 under a year ago. Farm work was not very active in this region, although planting of carrots and harvesting of other vegetables was making favorable progress in Arizona. Heavy feeding of livestock was required in portions of the range country.

Employment of farm workers in the Pacific Coast States rose 11,000 during January and was even up 6,000 from the February 1 number a year ago. Farm work being carried on in Washington State consisted mainly of preparing for the spring and summer activities, with some plowing being done west of the Cascades. In the fruit areas, the usual pruning was going on. Considerable damage was done to California artichokes and early germinated sugar beets by low temperatures and frosts, and much heating was required to prevent serious damage to citrus groves. Principal farm operations in California that required large numbers of seasonal workers were citrus harvests, vegetable harvest, packing, cultivation in most commercial vegetable areas, pruning of deciduous orchards and vineyards, cotton harvest in the San Joaquin Valley, potato planting, and ground preparation and seeding of the late spring grain and miscellaneous crops.
